Exercise 1: The Skull 💀

The idea of the exercise is that you must use all the p5.js functions you have been introduced to in the lessons so far. So **`setup()`**, **`createCanvas()`** , **`draw()`** , b**`ackground()`** , **`ellipse()`** or **`circle()`** , r**`ect()`** or **`square()`** and **`line()`**.

Specifically, use all of them (or as many as possible) to draw a skull. Muahahahaha 💀

Look up references on the p5.js website if you want to know more about the various functions.

★ Create a canvas in your **`setup()`** method. You can simply use the height and width that are determined automatically when you create a new sketch or experiment with the height and width yourself.

For example, there are also some pre-defined variables called **`windowHeight`** and **`windowWidth`** that you could also use. What values do they hold?

★ Next, determine a background color with **`background()`**.

If we don't want our shapes to have a colored edge, we can write

`noStroke()` on a separate line.

★ Then you need to make the main shell of the skull. Here you could use **`ellipse()`** to make a circle. Or a combination of several and different forms such as **`rect()`**. To add a specific color to a shape, use f**`ill()`**. Everything underneath **`fill()`** will be that color.

`White: fill(250);`

`Black: fill(0);`

For the eye holes we can use **`ellipse()`** again.

★ For the teeth of the skull, we can use a combination of square shapes and use **`rect()`** or a combination of **`rect()`** and **`line()`**.
